

Enterprise Contract Guide

1. Purpose and records

Owner: Contract Operations. Effective 2026-01-15. This guide explains how support and operations read fictional Negativex enterprise terms. The signed agreement, order form, and amendment remain authoritative. Every exception record includes contract identifier, account owner, amendment number, signed date, and effective date.

Enterprise Contract Guide

2. Order of precedence

For a conflict within an enterprise account, review the signed amendment first, then the master agreement, the order form, and finally the public service policy. Precedence applies only when the documents cover the same customer, service, metric, and time period.

3. Effective dates

Signed date and effective date are separate fields. A document may be signed in December and become effective in January. The operator uses the effective date for a service decision and retains the signed date for audit. Missing dates stop the exception workflow.

4. Account ownership

The account owner confirms which workspace and product family the term covers. A parent company's agreement is not automatically evidence for every subsidiary. Contract Operations records the workspace relationship before allowing a negotiated limit or remedy to be quoted.

5. Availability commitment

The fixture's example enterprise commitment is 99.95 percent monthly availability. Measurement window, excluded maintenance, and service-credit procedure are separate terms. Do not infer a credit amount from the percentage alone; the signed schedule and calculation record are required.

6. Service credits

A service credit is not the same as a refund, damages payment, or support response. The operator records measured availability, eligible service, incident exclusions, notice date, and the credit tier named by the agreement. An absent tier is escalated rather than filled from a public promise.

7. Retention terms

The default example for this fixture is 180 days, but retention is contract-specific. The effective amendment and data class determine whether the value applies to events, exports, or deleted records. Product documentation can describe a default and cannot override a signed retention term.

8. Digital goods

A negotiated enterprise term may permit a remedy for an activated digital entitlement where the public Digital Goods Policy normally does not. The entitlement ID, activation timestamp, contract clause, and approval are retained. A customer's enterprise status alone is insufficient.

9. Returns and regional terms

An enterprise order may contain a special return period, but the clause must identify the order or product scope. Regional statutory requirements are assessed for the transaction's jurisdiction. Contract Operations and the regional policy owner resolve overlap; support does not choose the more generous rule by default.

10. Amendment review

For each amendment, record the prior clause, the replacement clause, the affected service, and the transition date. A current amendment can supersede only the terms within its scope. Historical cases use the effective term at the relevant event, not the latest document opened by the agent.

11. Verification checklist

Before approving an exception, confirm: contract identifier; workspace; account owner; signed date; effective date; amendment number; clause scope; requested remedy; required approver; and customer communication. Store references rather than copying confidential full text into a support case.

12. Private integration limits

A private integration limit may be materially different from the public API value. The tenant-b example is maintained on its private limits page and is contract-controlled. It must not be generalized to another tenant or presented as the product-wide rate limit.

13. Dispute handling

If an account owner and support agent interpret a clause differently, pause the customer commitment and request Contract Operations review. The review records both interpretations, the source documents, and the decision owner. Urgency does not authorize an undocumented amendment.

14. Audit evidence

Auditors should be able to reconstruct who verified the contract, which version was effective, which metric was measured, and which customer message followed. Logs must not contain API keys, payment data, or unrelated tenant information.

15. Related documents

Related operational sources include Support Operations Playbook, Digital Goods Policy, Negativex Product Guide, and the regional return guides. They provide context or procedure; the signed agreement controls a negotiated enterprise term within its scope.
